

Low-dose, weight-bearing x-ray scan (EOS-imaging)

Measurements of the posture, spine and lower limbs of children and adults are made with a scanning imaging device. The examination is carried out using X-rays, so it is not suitable for pregnant women.

How to prepare for the procedure?

Remove jewelry and piercings before coming to the procedure. Belts, suspenders and bras as well as clothes containing buttons, zippers or metal are removed for the duration of the examination. The study does not require any other preparations.

How is the procedure done?

The procedure is performed while you stand in the imaging device. It is also possible to carry out children's imaging while sitting in a scanning chair.

The procedure is fast and it is important to stay still during imaging. The procedure does not cause pain. Urgent on-call examinations are also carried out at our department, so the start of the procedure may be delayed.

What about after the procedure?

The information obtained from the scan requires time-consuming processing and analysis, so the results are not ready immediately. You will receive the results from your referring doctor.
